

Objectives:

- Pseudo code – Motivation and Examples
- Computers are not magic
- Sign up for Turing's Craft
- Laptop setup issues? Post screenshot on Piazza

3. **Representing algorithms?**

(<http://userpages.wittenberg.edu/bshelburne/Comp150/Algorithms.htm>)

- Use natural languages
- Use formal programming languages
- **Pseudo-Code** - natural language constructs modeled to look like statements available in many programming languages

**Pseudo-Code** is a numbered list of instructions to perform some task.

1. *ordered sequence of operations*
2. each instruction is computable
3. complete

Three Categories of **Algorithmic Operations**:

1. sequential operations – instructions executed in order
2. conditional “question asking” operations – select from alternatives
3. iterative operations (loops) – repeating a block of instructions

4. Computing a Quiz Average: Pseudo-code to calculate a quiz average

1. get number of quizzes
2. sum := 0
3. count := 0
4. while count < number of quizzes
  - get quiz grade
  - sum = sum + quiz grade
  - count = count + 1
5. average = sum / number of quizzes
6. display average

1. Computer Science Terminology – did your neighbor do the readings?

Discuss with your neighbor what a Computer Scientists means by the following terms and give an example of each:

- fetch-execute cycle
- CPU
- opcode
- operand
- register
- condition code

2. Arithmetic can be done with binary numbers:

<https://www.youtube.com/watch?v=GcDshWmhF4A>

$$\begin{array}{r} 11110_2 \\ + 00111_2 \\ \hline \end{array}$$

2

5. Write pseudo-code to print the highest quiz score:

## 6. A simple machine language:

**ZERO\_REG DEST<sub>R</sub>** – puts a zero in the specified register.

**ADD SRC<sub>R1</sub> + SRC<sub>R2</sub> -> DEST<sub>R</sub>** – add two registers together and write the result in the destination register.

**ADD SRC<sub>R1</sub> + CONSTANT -> DEST<sub>R</sub>** – add a register to a constant and write the result in the destination register.

**SUB SRC<sub>R1</sub> - SRC<sub>R2</sub> -> DEST<sub>R</sub>** – subtract one register from another and write the result in the destination register.

**SUB SRC<sub>R1</sub> - CONSTANT -> DEST<sub>R</sub>** – subtract a constant from a register and write the result in the destination register.

**LOAD DEST<sub>R</sub> <- [BASE<sub>R</sub> + CONSTANT]** – add the value of a register to a constant to compute a memory address and copy 4 bytes starting at that address to the destination register.

**STORE SRC<sub>R1</sub> -> [BASE<sub>R</sub> + CONSTANT]** – add the value of a register to a constant to compute a memory address and copy the source register to 4 bytes of memory starting at that address.

**BR.\_\_\_\_ PCOFFSET** – the branch instruction specifies a combination of condition codes (n, z, p); if any of the specified condition codes holds a 1, the PC is set to PC + 2 + 2(PCOFFSET). Otherwise PC is set to PC + 2.

For all instructions other than the branch, PC is set to PC + 2. Any instruction that writes a general-purpose register also set the condition code bits: if new value is negative then n=1, else n=0; if new value is zero then z=1, else z=0; if new value is positive then p=1, else p=0.

## 7. Decoding an instruction:

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ADD <sup>+</sup>	0001				DR			SR1			0	00		SR2		
ADD <sup>+</sup>	0001				DR			SR1			1	constant5				
ZERO_REG <sup>+</sup>	0101				DR			0	0	0	1	0	0	0	0	0
BR	0000				n	z	p	PCoffset9								
LOAD <sup>+</sup>	0110				DR			BaseR			offset6					
STORE	0111				SR			BaseR			offset6					
SUB <sup>+</sup>	0001				DR			SR1			0	00		SR2		
SUB <sup>+</sup>	0001				DR			SR1			1	constant5				

## 8. Schematic of a CPU:

## 9. Decoding 16 bit-string instructions:

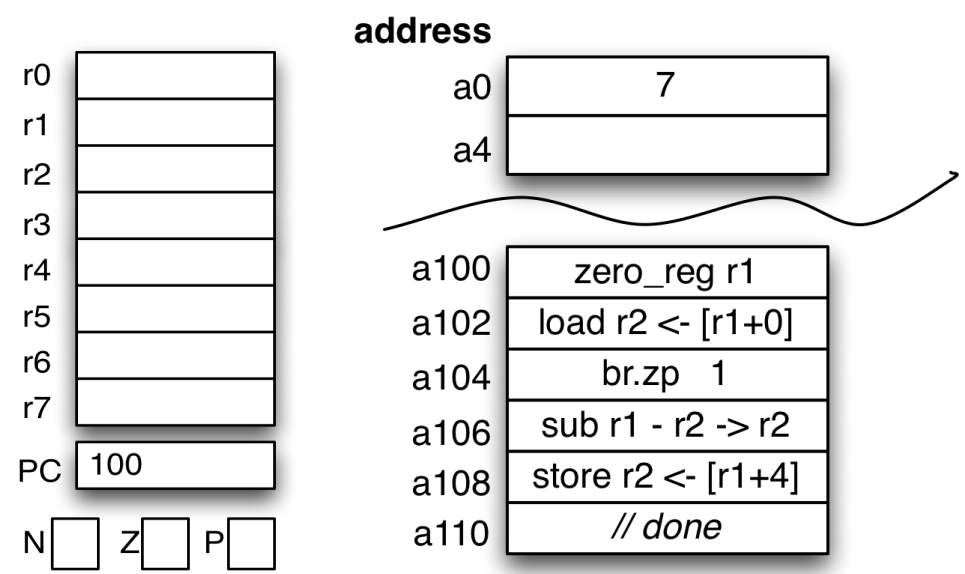

0111011001000100

0001100011000010

0101101000100000

0000110000001100

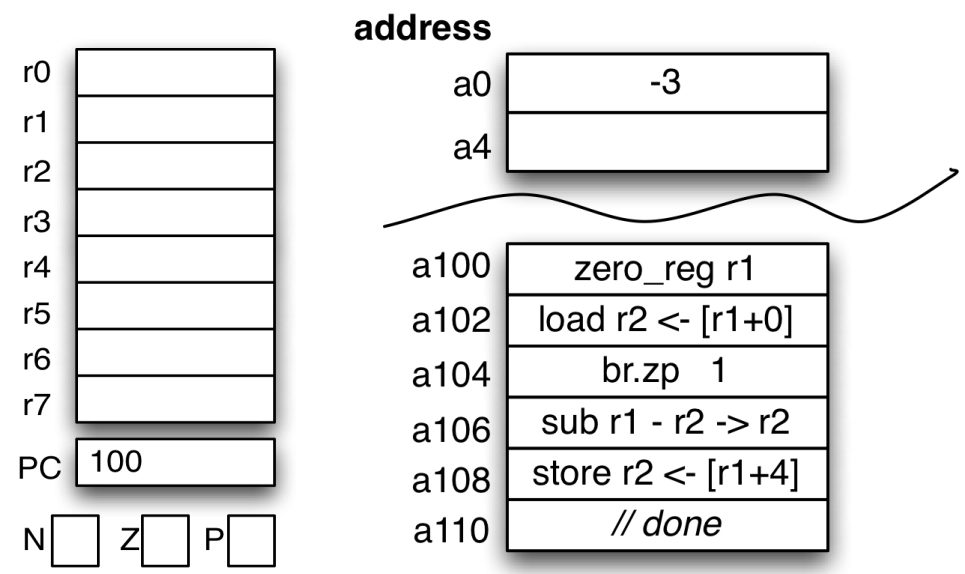

11. Execute a machine code program - me:

10. All about that branch, 'bout that branch ...

12. Execute a machine code program - you:

13. What does this code do?

Workspace:

14. Execute a machine code program - you:
